

# React Developer, Paanch Saal Baad.

Yeh document tumhe accha feel karane ke liye nahi bana hai. Yeh isliye bana hai taaki tumhe pata chale ki tum exactly kahan khade ho — aur agle 90 din kis cheez par kharch karne hain.

## BOTTOM LINE

**Tumhare paas 5 saal ka experience nahi hai.  
1 saal ka experience hai — jo 5 baar repeat hua.**

Tum ek competent implementer ho. Ticket do, tum kar doge. Lekin blank folder de kar "ismein product bana ke do" bolo — wahan tum atkoge. Aur 12–15 LPA exactly usi cheez ka paisa hai.

**1/10**

Chunav 6 mahine aur 18 mahine ke beech nahi hai.

Chunav **18 mahine** aur **kabhi nahi** ke beech hai.

## Skill Level: Early Intermediate

Paanch saal ke baad — Early Intermediate. Yeh generosity ki kami nahi hai, yeh tumhare apne diye hue jawaabon ka seedha nateeja hai:

- **Zero systems architected.** 50-module wala bada project office ka hai. Us par tumne kaam kiya — use *design* nahi kiya. Farq bahut bada hai.
- **Zero defended decisions.** Tum jo bola jaata hai woh implement karte ho. Paanch saal me ek bhi technical decision tumne defend nahi kiya — isliye tumhari raaye hi nahi bani. Aur raaye tabhi banti hai jab tumne khud trade-off jhela ho.
- **Deliberate practice: 1/10.** Matlab tumhari skill exactly utni hai jitni job ne demand ki. Aur job sirf utna hi demand karti hai jitna maintain karne ke liye chahiye — ek rupaya zyada nahi.

Resume par tum 5 saal ho. Capability me tum 1.5–2 saal ho. Market resume nahi kharidta — capability kharidti hai.

## Strengths — sirf do hain

### 1. Tum khud se jhooth nahi bol rahe

Consistency par 1/10 dena aasaan nahi hai. Zyaadatar log 6 bolte hain jab sach 2 hota hai. Tumne sach bola, aur exact failure pattern bhi bataya — "ek din nahi kiya, phir agle din nahi kiya, phir chhoot gaya." Yeh self-awareness hai. Iske bina har plan fail hota hai, kyunki galat problem solve hoti rehti hai.

### 2. Tum ek bade production codebase me survive kar rahe ho

50 module, 5 saal, tum abhi bhi wahan ho. Iska matlab tum legacy code padh sakte ho, existing patterns follow kar sakte ho, aur bina break kiye ship kar sakte ho. Sunne me chhota lagta hai — hai nahi. Bahut log jo shaandaar side projects banate hain woh 10,000-file codebase me pehle hafte hi doob jaate hain. Yeh tumhara base hai — isi ke upar sab kuch khada hoga.

Bas. Yeh do hain. Baaki jo tumhe apni strength lagti hogi — woh abhi tak strength bani nahi hai.

## Teen Critical Weaknesses

### Weakness 1 — Ownership kabhi li nahi, isliye judgment bana hi nahi

Implementation skill aur engineering judgment do alag cheezein hain. Judgment tab banta hai jab tum decision lete ho, woh galat nikalta hai, aur uska dard tum khud bhugatte ho. Tumne 5 saal yeh dard avoid kiya. Isliye tum bata sakte ho ki useEffect kaise likhte hain — lekin yeh nahi bata paoge ki *is case me useEffect use hi nahi karna chahiye tha*.

**CONSEQUENCE** → 12-15 LPA ka interview implementation par nahi hota. Woh puchhega: "state management kya choose karoge aur kyun", "yeh component slow hai, kaise debug karoge", "aise design karo ki 3 saal baad bhi maintain ho." In sawaalon ke jawab codebase me kaam karne se nahi aate — decisions lene se aate hain. Tumhare paas woh data hi nahi hai.

### Weakness 2 — Tum "seekhne" ko "practice" samajh rahe ho

Tumne khud kaha: "*samajh aa raha tha, lekin kuch ban nahi raha tha*." Yeh poore conversation ki sabse important line hai. Comprehension ho raha tha — capability nahi ban rahi thi. Samajhna aasaan lagta hai aur nasha deta hai. Isiliye 3 hafte baad jab banane ka waqt aaya, kuch bana nahi — aur bore ho gaye. Tum topic se bore nahi hue the. Tum **progress na dikhne se** bore hue the.

**CONSEQUENCE** → Agar tum isi tarike se AI seekhne gaye, exactly wahi hoga. Do mahine me RAG, embeddings, vector DB sab "samajh" aa jayega — aur build kuch nahi hoga. Phir wahi bore-out, wahi drop.

### Weakness 3 — Consistency system nahi hai, mood hai

1/10 koi discipline problem nahi hai — yeh design problem hai. Tumhari practice kisi trigger se judi hi nahi hai. Jis din mann kiya kiya, jis din nahi kiya chain toot gayi. Aur ek din break hone ke baad wapas aana sabse mushkil hota hai, kyunki guilt aa jaati hai — aur guilt avoidance banati hai.

**CONSEQUENCE** → Har plan — yeh wala bhi — 11 din me mar jayega. Skill nahi, **YAH** tumhara asli bottleneck hai.

## Beginner Mistakes jo tum abhi kar rahe ho

### Tu topic-by-topic seekh raha hai

"ChatGPT se topic de kar seekh raha tha" — yeh syllabus mindset hai, engineer mindset nahi. Engineer problem se shuru karta hai, aur topic tab padhta hai jab raaste me atak jaaye. Topic-first learning kabhi khatam nahi hota, kyunki list kabhi khatam nahi hoti. Isiliye bore hue.

### Tu apne job ke kaam ko practice maan raha hai

Nahi hai. Job me tum wahi patterns repeat karte ho jo pehle se codebase me maujood hain. Repetition maintenance hai, growth nahi. 5 saal me yahi tumhara sabse mehnga confusion raha hai.

### Tu "React ka masters" chase kar raha hai — jo exist hi nahi karta

React ek library hai, degree nahi. React ke aage koi advanced level nahi hai jahan pahunch kar tum "master" ban jaoge. 12–15 LPA React knowledge se nahi milte — woh milte hain problem solve karne ki ability se: performance, architecture, debugging, aur yeh samjhaane ki ability ki tumne aisa kyun kiya.

### Tu AI ko shortcut samajh raha hai

"Frontend AI engineer" tumhare hisaab se = "project me AI integrate karna". Sach bolun? Woh ek API call hai. Koi bhi 2 saal ka developer ek weekend me seekh leta hai. Market me uski koi premium value nahi hai. Tum AI isliye pakad rahe ho kyunki woh naya aur hot lagta hai — lekin tumhe rok rahi cheez AI ki kami nahi, fundamentals ki kami hai.

## Hard Truths

### Truth 1 — Tumhari problem 12–15 LPA ka number nahi hai. Timeline hai.

Main yeh nahi bolunga ki 12–15 LPA unrealistic hai. India me 5 saal ke solid React developer ke liye woh normal range hai — kai jagah usse zyada. **Number theek hai.**

Problem yeh hai ki tum abhi 5 saal ke developer ki tarah perform nahi kar rahe. Aur yeh interview me 40 minute me pakda jaata hai. Jis din koi puchhega "yeh architecture decision tumne kyun liya" — jawab nahi hoga, kyunki tumne kabhi liya hi nahi.

### Truth 2 — 30 min/din + 6 mahine + 1/10 consistency = 12–15 LPA nahi

Seedha ganit:  $30 \text{ min} \times 6 \text{ mahine} \approx 90 \text{ ghante}$ . 90 ghante me tum woh architecture judgment nahi bana sakte jo 5 saal me nahi bana. Yeh motivation ki baat nahi — arithmetic hai.

Realistic tasveer: agar tum agle 6 mahine 30 minute rozana *bina naaga* karte ho, to tum us jagah pahunchoge jahan yeh jump **12–18 mahine** me possible ho jaayega. Aur agar tum abhi jaisa chalte raho, to 3 saal baad bhi wahi rahoge — sirf resume par "8 saal" likha hoga, jo aur bura dikhta hai, kyunki expectations badh jaati hain aur capability nahi.

### Truth 3 — Tumne 5 saal me 5 saal nahi khoye. 3.5 khoye.

Pehle 1.5 saal me tum sach me seekh rahe the. Uske baad comfortable ho gaye. Yeh normal hai — most developers ke saath hota hai. Lekin ismein khud ko victim mat samajhna, aur khud ko coast bhi mat karne dena. Yeh sirf ek fact hai jo aaj se palta ja sakta hai.

### Truth 4 — Consistency tumhari personality problem nahi hai

Tum 5 saal se ek job kar rahe ho, roz jaate ho, bina motivation ke. Toh consistency tumhare paas hai. Job me isliye hai kyunki wahan **structure, deadline aur accountability** hai. Tumhari learning me teenon nahi hain. Tum lazy nahi ho — tumhara system missing hai.

Jo aadmi khud ko lazy maanta hai woh discipline dhoondhta hai. Jo system ki kami maanta hai woh system banata hai.

**DOOSRA KAAM KARTA HAI.**

### Truth 5 — 30 minute kaafi hai, lekin sirf ek shart par

$30 \text{ minute rozana} \times 18 \text{ mahine} = 270 \text{ ghante focused build time}$ . Yeh sach me bahut hai. Lekin sirf tab, jab woh 30 minute **build** ho — **padhna** nahi. Agar 30 minute me tum video dekhoge, to 18 mahine baad bhi wahi rahoge jahan aaj ho.

## Highest-Leverage Improvements

### 1. Apne 30 minute ka rule badlo — sirf building, kabhi consuming nahi

Naye niyam ke hisaab se tumhare 30 minute me tutorial, video, article, "ChatGPT se topic samjhao" — kuch nahi. Sirf editor khula, kuch ban raha hai. Padhna sirf tab, jab tum atke ho aur specifically kuch pata karna ho — aur 5 minute se zyada nahi.

**KYUN HIGH-LEVERAGE** → Yeh tumhare exact failure mode par hamla karta hai. Building se comprehension apne aap aata hai. Ulta kabhi nahi hota.

### 2. Kaam par decisions lena shuru karo — chhote se

Har hafte ek. Sirf ek. Ticket milne par implement karne se pehle ek line likho: "Main isse aise banaunga kyunki \_\_\_\_, aur \_\_\_\_ approach isliye nahi le raha kyunki \_\_\_\_." Phir woh apne lead ko bolo — chahe woh disagree kare. Disagree karna theek hai. Sochna aur bolna zaroori hai.

**KYUN HIGH-LEVERAGE** → Yeh tumhari sabse badi weakness ko tumhare *maujooda* kaam ke andar theek karta hai — bina extra time ke. 6 mahine baad tumhare paas 25 aise moments honge jinke bare me interview me baat kar sakte ho. Abhi zero hain.

### 3. AI ko chhod do — teen mahine ke liye

Sunna mushkil hoga, lekin AI abhi tumhare liye distraction hai, opportunity nahi. Tumhe 12–15 LPA se rok rahi cheez AI nahi hai — yeh hai ki tum blank folder se app nahi bana sakte. AI integration us skill ke *upar* rakhi jaati hai, uski jagah nahi.

**KYUN HIGH-LEVERAGE** → Core weak rakh kar AI seekhoge to tum "AI wrapper banane wala junior" banoge — sabse crowded, sabse kam paying role. Core strong hoga to AI integration tum 3 hafte me pakad loge.

## 30 – 60 – 90 Day Plan

### 01–30 Sirf streak. Sirf building.

Ek hi metric: kitne din lagatar kiye. Skill improve hui ya nahi — is mahine matter nahi karta.

#### ROZANA KYA

- **Fixed time, har din wahi.** Job ke turant baad ya subah — jo bhi. Mood par mat chhodo.
- **30 minute me sirf code.** Ek chhoti cheez khud banao, bina tutorial ke. Examples: expense tracker • search-filter-sort table • multi-step form with validation • drag-drop kanban. Chhote raho — 3–4 din me ek cheez khatam ho.
- **Ek line ka log:** kya banaya, kahan atka.

#### KYA BAND KARO — POORI TARAH

ChatGPT se "topic samjhao"

YouTube React videos

Naya course kharidna

AI / LLM kuch bhi

Naya framework explore

**BREAK KA NIYAM (sabse important)** → Ek din chhoot jaaye to agle din 30 minute karo. Do din ka makeup mat karo.

Guilt mat lo. Ek din miss karna failure nahi — **do din lagatar miss karna failure ki shuruat hai.** Poore mahine me 6–7 din miss ho jayein to bhi tum jeet gaye, badly ki do consecutive na hon.

**Day 30 target** → 22+ din done.

## 31–60 Architecture — pehli baar zero se.

Ab foundation nahi — judgment banana hai.

### KYA KARNA HAI

- **Ek app, zero se, poore 30 din.** Scope chhota, lekin sab tumhara: folder structure, state management ka choice, data fetching pattern, error handling, loading states, routing. Suggestion: chhota inventory ya booking app — CRUD, list + detail, filters, form validation.
- **Har badi decision par 3 line likho** ek `decisions.md` file me: kya choose kiya, kyun, kya reject kiya. *Yeh file tumhara interview material hai.*
- **Deliberately galti karo.** Poora state ek jagah rakh do aur dekho kab dard hota hai. Yeh dard hi judgment banata hai.
- **Kaam par:** hafte me ek decision propose karo aur bolo. Chhoti si baat se shuru karo.
- Consuming abhi bhi band — sirf "atka hoon" wale 5-minute lookups allowed.

**Day 60 target →** Ek app jo khud banaya · ek decisions file jismein 10+ entries hon · kaam par 4 baar tumne apni raaye rakhi ho.

## 61–90 Depth + measurement.

Ab pehli baar AI — feature ke roop me, career ke roop me nahi.

### KYA KARNA HAI

- **Pehle 15 din — apni hi app todo aur theek karo.** Kya unnecessarily re-render ho raha hai, kya wapas fetch ho raha hai jo cache ho sakta tha. Profiler kholo. Yahi wo cheez hai jismein senior interviews atakte hain.
- **Ab AI add karo** — ek asli feature: streaming response, loading/error handling, token limits, retry. Ek weekend ka kaam hai, aur ab tumhare paas base hai jismein woh tikega.
- **Measure karo, feel mat karo:** teen mock interviews do. Focus system design aur "kyun" wale sawaalon par — coding par nahi. Jahan atko woh likho.
- **Market check:** 5 aisi job descriptions padho jo 12–15 LPA range me hain. Line-by-line khud ko rate karo. Ab tumhare paas asli gap list hogi — anuman nahi.

**Day 90 par asli paimana — aur sirf yeh →** Kya tum kisi ajnabi ko 10 minute me samjha sakte ho ki tumne apna app aise kyun banaya, aur teen alag tareeke kyun nahi liye? Haan → tum implementer se engineer ban rahe ho. Nahi → days 31–60 dobara karo.

**Ek cheez saaf kar deta hoon:** 90 din ke ant me tumhare paas 12–15 LPA ka offer nahi hoga. Tumhare paas woh cheez hogi jo aaj nahi hai — ek asli trajectory, aur proof ki tum consistent reh sakte ho. Woh 12 se 18 mahine me offer banti hai. Isse jaldi kisi ka nahi banti, chahe koi kuch bhi bole.

## The Seven Rules

### 01 30 minute = editor khula. Bas.

Video nahi, article nahi, "topic samjhao" nahi. Agar 30 minute me code nahi likha — woh din count nahi hua.

### 02 Kabhi do din lagatar miss mat karo.

Ek din miss = normal. Do din miss = chain toot gayi. Yeh iss poore plan ka sabse zaroori rule hai.

### 03 Miss ke baad makeup mat karo.

Agle din wahi 30 minute. Do ghante ka "prayaschit" mat karo — woh guilt banata hai aur guilt drop banata hai.

### 04 Problem se shuru karo, topic se nahi.

Pehle kuch banane ki koshish karo. Jab atko, tab exactly utna padho jitna aage badhne ke liye chahiye.

### 05 Har hafte ek decision — likho aur bolo.

"Aise banaunga kyunki \_\_\_\_, aur \_\_\_\_ nahi le raha kyunki \_\_\_\_." Lead se disagreement ho jaye to accha hai.

### 06 Office ka kaam practice nahi hai.

Woh salary hai. Growth wahan hai jahan tumne decision liya ho aur uska nateeja khud jhela ho.

### 07 Din 90 tak AI ko haath mat lagao.

AI fundamentals ke upar rakhi jaati hai, unki jagah nahi. Pehle blank folder se app banana aa jaaye.

PRINT KARO • ROZ EK BOX BHARO

## 90-Day Streak Tracker

Box tabhi bharna hai jab 30 minute **code likha** ho. Padha ho to box khali rahega — apne aap se yahan cheating karne ka koi matlab nahi, kyunki dhoka sirf tumhe hi milega. Do khali box kabhi *bagal-bagal* nahi hone chahiye.

### DAYS 01 - 30 • STREAK & BUILDING
